

Internship: Data Analysis and Algorithm Development

(3+ months, 80%-100%, Zürich, as soon as possible)

CycloWatt is a young startup developing the next generation of cycling power meters for hobby cyclists. Over the past months, we have built our first prototype and advanced it into a beta product, which is currently being tested by a selected group of users. With your support, we aim to move toward a production ready design that elevates user experience.

If you are motivated to build on a solid beta-stage foundation, identify improvements, and work towards a product ready firmware on our sensor platform, this is your chance. Your work will directly contribute to shaping a final product ready for market launch.

The Job

In this role, you will work on our firmware that handles data collection, processing, and communication over Bluetooth. Furthermore, you will further develop our power calculation algorithm and analyze collected data to come up with improvements.

This will require you to understand the mechanical translation of the applied force on a cycling pedal to our sensing units and then processing it to a power output. Based on this understanding you will collect data and further develop our algorithm where you will work on data analysis scripts, investigate offline possible algorithms and then translate this to C/C++ code to integrate into the firmware.

To tackle this challenge, we are looking for someone who can further develop the data processing pipeline and transfer it to our product. You will start working on the current code base and test your developments directly on our hardware.

For this position, we are looking for someone who can relate to the cycling world and has experience with embedded programming as well as data processing.

Your Profile

You should bring experience in the following areas:

- Working with microcontrollers
- C/C++
- Python
- Zephyr
- Motivated, curious, and ready to learn quickly in a startup setting
